

Esteban Rojas

Product Engineer

Medellín, Colombia (UTC-5) · Remote esteban7590@hotmail.com linkedin.com/in/estebanrojasl github.com/estebanrojasl

I take apps that were vibecoded into existence and turn them into production platforms that hold up. I build with structured AI workflows, and I answer for everything that comes out of them.

On client work I run the whole thing myself: the discovery calls, the estimate, the contract, the architecture, the release and the support after. I quote a fixed price. Once I misread a requirement in a discovery call and went about 20 hours over. I absorbed it and didn't renegotiate. Now every feature is written down and signed off before I build it.

Lately most of my work is helping businesses put AI into their daily operations, so the owners can spend their time on real decisions. It has to be reliable, so a person stays in the loop. On the side I'm building lead and content engines that do the research and the drafting, and leave the owner one click to send.

What I want next is the loop I had at Snappr: ship something, watch how people use it, own the number and keep making it better.

SELECTED EXPERIENCE

Anytime Sim Golf · Lead Product Engineer

May 2024 to present

Canada · Client project

Golf simulator facilities with no staff on site. The software books the bay, takes the payment, and runs the lights and the simulators. It replaced a mix of Shopify and Zapier.

The scary part was the hardware. I was in Medellín and the simulators were in Canada, so I couldn't walk over and try things. I dealt with that first, with tests, retries and fallbacks around every hardware call. Once that was solid it was a normal software project, and the biggest risk was gone before most features existed.

I owned it from the estimate and contract to production. We started as two developers and I finished it alone, on a plain TypeScript monolith so one person could move fast. I also pitched features. One was a one-click extension: 10 minutes before your session ends, if the next slot is free, you get a discount to stay. At peak hours the next slot is almost always booked, so the offer can't fire, and people were asking to extend anyway. That told me the real lever was off-peak pricing. It's live, and the client now licenses it to other facility owners. I wrote the technical brief for the multi-tenant version.

The Salvation Army Southern California · AI-Native Product Engineer

Jun 2026 to Sep 2026

United States · Client project

Rebuilt the internal portal for about 9,000 employees on ASP.NET Core, React and Azure with Entra ID sign-in, replacing an old WordPress site. The usual estimate was about 240 hours. With my AI workflow it took about 70, and the client had a test environment two weeks after approval. This project is why I moved to fixed pricing.

Beach Management Nosara · Lead Product Engineer

Jul 2024 to present

Costa Rica · Client project

Luxury vacation rentals. I built their platform from scratch and ran it: the roadmap, the integrations with their rental software, the infrastructure.

Then the client told me they needed more bookings. That isn't an engineering ticket, but I went into the data anyway. Many guests asked questions before booking, got a weak answer or no answer at all, and left. So I built a guest reply assistant to make sure those questions get a good answer. It recovered about 10% of the bookings we were losing that way.

Snappr (YC) - Software Engineer

Aug 2021 to Mar 2023

San Francisco, remote · In-house

On-demand photography marketplace, and my one in-house job so far. Engineers there were part of the product and data decisions, and that is what I want back.

One year the company goal was to close five enterprise "whale" accounts. At an onsite the team brainstormed ways to help sales, and I said I'd own one of the ideas. I built a proxy that loads any prospect's website and swaps their photos for versions from our editing pipeline, with a toggle to flip between before and after. Sales could show a prospect their own site, already improved. It took me about three weeks. Sales used it with dozens of prospects, Vrbo among them, and it helped close one of the whales. The most useful thing I built there was a sales tool, not a product feature.

And more. Vaquenda (AgTech operations, AI event registration, led two engineers), AtlasPro AI, OpenPath (hosted checkout in .NET and React), GOAT Legend, Easy Apply (AI hiring MVP), Fundación Ideas para la Paz, and Vexi, an EV charging startup I co-founded. Full history on LinkedIn.

SKILLS

Product	Discovery, scoping and estimates, talking to clients and users, technical sales
Engineering	TypeScript, React, Next.js, Node, C#/.NET, Laravel, Postgres, MySQL, Stripe, OCPP (EV chargers)
Cloud	Azure, AWS, Vercel, Railway, CI/CD
AI	Claude Code with my own skills, agentic coding loops in Docker, LLM features in products
Languages	Spanish (native), English (C1, fluent)
